Snetclass in new 6.5 version.

Order today and get the licenses code in the e-mail - we sell all over the world.

Read the whole test below!

Snetclass is released in a new version - v 6.0.

This is a classroom software that enables the teacher/educator to have access to all students computer screens. This educational computer lab software offers alot of functions.

We have tested the software, read the full test below.

We can also offer you to order the full license here at IWBUsers.com. We deliver all over the world directly from the manufacturer, you get a link for download and activates the software thru the manufacturer directly. Snetclass teacher license and 100 student licenses is included to a really low price for this type of software!

You buy safe and secure thru credit card by Pay Pal in our webshop.

Alot of funcionality as found in much more expensive solutions and even more!

## INSTALLATION

Snetclass is installed as a teacher software and separate student software. The teacher software is what you pay for, student licences are almost unlimited since it allows 100 students to connect to one teacher at the same time. Normally it should be used in a classroom of 20-30 students.

We found the installation to be really straight forward. The students that should be in the same LAN/room connects easily. We have done test thru VPN but as with other classroom softwares this could be harder to get running due to firewalls etc.

## AFTER INSTALLATION

Now the fun begins to explore all the functions. And there are a lot to explore.

The teacher can get a full screen with easy overview (as the picture above), here the teacher see all students that are connected and can choose what to do.

As a classroom software you can ofcourse view all the students PC screens so that everyone works with the task given. Snetclass also offers you to broadcast your own screen or a student screen to all others.

The Silence function is the computer class teachers dream. When you want focus to be put on you just push the Silence button and all student computers are locked so that the students can look on you. The screen message can easily be changed.

With screen recording you easily can record what happens on your screen, the recording can then be saved for later playback thru the screen playback function to all students. This function is one of the fastest we have seen properly since it uses its own format. You can select if you want to record sound/voice as well.

Students can also record on their client and then playback locally. For instance record something that the teacher shows if they see the need for that.

The features program control and web control offers you to disable some programs or internet webpages to be started / visited. Simply add the webpages / applications that the students should use or not use and the students can't access it, by a click of a button you can enable them access to the page again.

Really simple interface functions Windows style. Below Program control and Web control.

Net cinema allows the teacher to broadcast a video file to all students so that when played it displays all over the screen. Works with some video codecs but not all formats.

Remote setting may not be used that much but with this you can set for instance the screen resolution for a student computer. You can also save setting for easy upload when needed. Could be useful if student PCs aren't locked so that settings are changed by students.

File distribution is really smart. Students can send one or more files to the teacher. The files are saved automatically in a folder preset by the teacher.

When the teacher sends files to students the teacher can select where on the student PCs "windows folders" the file should be placed. For instance Desktop, My documents etc.

## SUMMARY

Among all the features mentioned you can also easily chat both with text, raise hands do voice broadcast, voice chat etc.

When working with your teacher PC you have a tool bar that automatically pops up when you go to the top of the screen. You can also paint on all screens to explain even better or to use with a Interactive whiteboard it works perfectly!

Really simple to use and since there is text when hovering icons it becomes even simpler.

We didn't have to open the manual even once!

We give this software:

Want this software?

You can put a order directly in the shop to get a full license.
