

SMART announces SMART Notebook Math

Contributed by Administrator
Sunday, 03 May 2009

Educators from around the world can sign up now to download the beta and provide feedback on their experience with the product. SMART Notebook Math software is the only software for teaching math on an interactive whiteboard that provides the digital tools needed to create content, and to recognize and graph equations within the context of a lesson.

The application has all the functionality and features of award-winning SMART Notebook software, with math-focused content and tools for middle, secondary and post-secondary educators.

SMART Notebook Math comes with dynamic graphing tools that enable educators to create their own graphs or graph mathematical functions or tables of values. It is also easy to launch any Texas Instruments calculator emulator. The application also features a handwriting recognition function that recognizes individual math symbols and full equations, and can then solve equations.
